

## **Brave AI**

As a Practice, we are using BRAVE AI which serves as a clinical decision support tool, empowering clinicians to make well-informed decisions about individualised care plans. The tool itself **does not** autonomously make decisions regarding interventions; instead, it assists healthcare professionals in their decision-making process. The primary objective of BRAVE AI is to promote preventive healthcare practices over reactive treatments.

BRAVE AI employs computer algorithms to evaluate the complexity of each patient's health needs within our practice. By assigning a score, it helps identify individuals at risk of deteriorating health, potentially necessitating hospitalisation. This innovative tool enhances our ability to recognise patients who may otherwise be overlooked, including those with borderline health indicators or infrequent medical interactions.

In order to identify a patient who may benefit from interventions on the BRAVE AI tool we will use your NHS number. All data processed by BRAVE AI is stored securely and confidential patient information is exclusively disclosed to clinical teams directly involved in patient care.

Should you have any questions or concerns regarding the processing of your data alongside BRAVE AI, we encourage you to contact us at The Bovey Tracey & Chudleigh Practice.
